Based on these results, we should resample these sites. The low counts could be inhibited and the TNTC should have been diluted to get a better count, I'm guessing.

Thanks, we don't want these results.

It's a SE-DIST event. Results below and report attached.

Field IDs:
G4SE0027- 30.1 mpn/100mL
G4SE0099- 28.1 mpn/100mL
G4SE0119- 2419.8 mpn/100mL (so maxed out)

Kara,
Thanks for letting me know about this. I'd like to see the results, which sites and the levels matter. Can you please share this info we us?

Julie

Subject: J-qualified samples

Hey Julie,

I'm reaching out to let you know that one of our overflow labs, Pace didn't dilute one of the last group of samples they received. The samples were marine but the samplers didn't indicate that on the chain of custody. Per the method, marine samples should be diluted at least tenfold. Anyways, we will have to J-qualify the data if we keep it. (J-qualified data includes maxed out QT trays as well, and I think you guys include those results for assessment). We actually just went through this with Pace a couple weeks ago and they said that if marine/fresh wasn't indicated, they would just go ahead and dilute them. It's fine to dilute fresh samples too so that was a good solution but now it's happened again. I sent an email out to samplers requesting they include fresh/marine on the chain of custody but the dilution requirement is per the method so it seems like the lab should really have extra steps in place to figure out if a sample is marine. Do you guys still want these results?

Thanks, Kara
