Subject:	sulfate reduction along a salinity gradient in estuaries
Date:	Wednesday, February 25, 2009 11:05:38 AM

From the Gulf of Mexico mercury modeling Scope of Work:
"Because sulfate reduction (and likely methylmercury production) likely occurs along a salinity gradient in estuaries, the estuary box in the model will be sub-divided into three boxes representing different salinity regimes: oligohaline; mesohaline; and polyhaline."

Curt,

I think that Eric Roden (CCed) may have some insight into the matter of rate of *sulfate reduction along a salinity gradient in estuaries.*

Eric, your thoughts please.

Don
