All –

I recalculated the load estimates by load/acre. Attached are some slides with the graphs displaying that information for TN and TP for the "middle" upper WBIDs and the "upper" upper WBIDs, as well as the land use pie charts. In the "middle" WBIDs, the WBIDs with the highest TN and TP loading have ag as a pretty big land use. This is also the case in the "upper" WBIDs, where TN and TP loading is higher in WBIDs dominated by ag or urban land uses.

Let me know what you think of this information, and whether you think we should bring it up at the meeting tomorrow.

Thanks,
Moira
