Good morning, Karen,
Andy is out for 6 weeks with his new baby. He may be checking emails during his time away. Meantime, Chris Carstens is cc'd on all these emails and is keeping our sectioned "corralled". You may have seen this explanation for the 94 year project life in our FY22/23 LGFR, but if not, here it is:

SLWI project life = 94 years. The proposed trap expansion is expected to entail an initial construction event to remove rock and maintenance to dredge the incremental increase of impounded sand during its project life. The trap expansion will continue to benefit the inlet as long as the inlet is maintained. The inlet was initially constructed in 1927 and has been maintained to date (94 years). Therefore, the project life of the proposed trap expansion was assumed to be equivalent to this demonstrated commitment to managing and maintaining the inlet.

Thank you,
Tracy

Hi Andy,

Would you please provide an explanation for estimating the project life for SLWI as 94 years instead of the normal 50 years estimated project life. I know we had discussed this during the SLWI sand transfer plant tour on Sept 16th. Just need something in writing to clarify using the estimated 94 year project life.

Greatly appreciate your help in this matter.

Thank you,

Karen Milicic
