All:

If you are receiving this email I have identified you as a potential contributor to a book chapter on sulfur in the Everglades. I sent out a preliminary email to many of you in July concerning this. Attached below is an outline for the book chapter with various individuals names by each section. I have assigned a lead to each section, and potential contributors to each section. The leads for each section are most important, as they will contact the contributors and do much of the writing and organizing for the section.The contributors role may be to contribute some writing, figures, or to merely help review the section once it is completed. I have tried to distribute the leads around to different organizations working on this issue so we may maintain a balanced view of this somewhat contentious issue. If anyone is uncomfortable with being a lead or contributor for whatever reason, please let me know. Also, If I have missed someone who you think should be a contributor let me know. I know everyone is pretty busy, but I hope you will all be able to find the time to contribute to this chapter on sulfur.

We have a reasonable time frame to complete this. The final version is due in to the Editor's of the book by December 20. Below is a proposed schedule:

now to mid-October:	Leads for each section contact contributors (maybe by conference call) and figure out who writes what, what figures, etc.
October 24:	Leads for each Chapter send a roughed-in outline of their section with probable figures, tables, etc. to Orem
November 24:	Contributors send all materials to leads for each section
December 5	Leads send completed sections to Orem
December 20	Orem sends completed chapter to editor's

Leads can feel free to alter this proposed schedule as fits their needs, but I'd like to have completed sections to me by December 5 so I have time to assemble the sections together into a coherent package. I'll send the completed chapter out to all contributors. Once again, thanks to all for your willingness to contribute to this effort on what I consider to be a key water quality issue in the Everglades.

Bill
