Subject: Triennial Review of Florida's Water Quality Standards

Dear Official, Please adopt the 2016 EPA draft recommended water quality criteria of 4 micrograms per liter for microcystin and 8 micrograms per liter for cylindrospermopsin to best protect recreational users and restore Florida's imperiled waters.

I am a kayaker who spends time weekly in our local waters and am acutely aware of the degradation of our water quality and the danger to human health caused by exposure to cyanobacteria.

This is a problem of potentially catastrophic proportions! If wind can carry sand from the Sahara to affect our red tide, it can surely carry the cyanobacteria poisons throughout Florida, causing disease and death for millions.

I implore those who have power in this situation to do all possible to avert this disaster.
