**Subject:** Triennial Review of Florida's Water Quality Standards

Kaitlyn, please allowed me to help share my view of the current water quality challenges we all face today. First we have to note we face these water challenges today because our elected leaders refused to address clear and present danger we all knew about 30+ years ago. Since 1972 it was a fact that high nutrient loads and sediment will create toxic waters. For 47 years the leaders in FL have allowed our FL life style to become polluted to the point our kids cannot even touch or safely breath the air around our public bodies of waters most of the summers.

This now requires hyper levels of action to address this active crisis we have force upon the people of our state. No educated and conscious adult mind could find no logical reason to do all and anything we can to ensure our kids do not have suffer another lost and toxic summer their lives short childhood. We owe them all efforts into allowing them to grow up in the threatened FL life style.

Please adopt the 2016 EPA draft recommended water quality criteria of 4 micrograms per liter for microcystin and 8 micrograms per liter for cylindrospermopsin to best protect recreational users and restore Florida's imperiled waters.

Thank you,

Anthony D'Andrea
