Subject: Algae,and the truest way to stop it

As you well know,im sure,TEAMS of spray boats infest our public lakes and canals,creeks,and rivers.they continue to spray these poisonous chemicals,pretty much at will,over everything green they see. This is stunningly ridiculous,and a real health hazard to wildlife,and ultimately,us.we are asking that this be curtailed, by 2/3rds minimum. We are gathering strength in numbers and have the media firmly on our side,as it affects every soul living around this state.leave the weeds alone,they are the cheapest,most efficient way to filter water by far. If we turn all our lakes into weedless mudholes,nothing will stem wave action, and that just muddys up the entire lake system. Canals, are generally deep enough to minimize massive weed growth,and we can use muncher boats to skim these weeds out of them, lake okeechobee,is a different animal,its very shallow,and muncher boats,have to have a certain depth of water to be effective.just leave the weeds grow,and maybe come in a spot treat,instead of just annihilating everything to the detriment of the entire ecosystem.thank you for your time,Capt.Doug Harris,loxahatchee ,fl.
