Subject: Triennial Review of Florida's Water Quality Standards

I am writing as a citizen who lives in an area affected by harmful algae blooms to respectfully request that the Florida Department of Environmental Protection adopt the 2016 EPA draft recommended water quality criteria of 4 micrograms per liter for microcystin and 8 micrograms per liter for cylindrospermopsin to best protect recreational users and restore Florida's imperiled waters. There is sufficient scientific evidence to support that amount in excess of that pose a serious public health risk. To protect the designated use of these waters according to the Clean Water Act as well as to ensure public safety, these criteria need to be adopted without delay. Thank you for considering this request, Jennifer Hecker
