

Updating Geographic Location (Lat/Long) Training Video Transcript

This video will demonstrate how to update a Geographic Location (lat/long) when you receive new lat/long coordinates, for example, from a surveyor or consultant.

Click on the Geographic Locations tab, and double click on the record you want to update. On this screen, you can update the lat/long coordinates.

For Coordinate Method, use the List of Values.

For Proximity to Object, use the List of Values.

If the Collecting Environmental Interest is blank or needs updating, use the List of Values to select Solid Waste Management.

Enter the name of the person who collected the information for Collected By, the Collector Affiliation, and the Collection Date.

To verify these updated coordinates, click Launch/Populate GIS.

If the location is accurate, select Return Shape Edits.

Select OK and click Launch/Populate GIS a second time. Note that all verification fields have been populated.

Once you select Commit Changes, the Geographic Location for the General Disposal or Processing Record has been updated.

Exit back to the Facility Information screen to update any remaining Geographic Location records and repeat the process for each.

For a WACS ID, Geographic Location records can be at the same location or they can be in slightly different locations. This record was updated so the Facility location is at the Entrance, while the Processing location is at the Center of the waste processing operation. When updating location, you will typically need to relocate at least two records.

To visually move a location, refer to the *Updating Geographic Location (Lat/Long) Using WebShapeLite* training video.
