BULLETIN OF THE UNITED STATES NATIONAL MUSEUM.

ISSUED DECEMBER 31, 1912.

ADVERTISEMENT.

The scientific publications of the United States National Museum consist of two series—the *Proceedings* and the *Bulletins*.

The *Proceedings*, the first volume of which was issued in 1878, are intended primarily as a medium for the publication of original, and usually brief, papers based on the collections of the National Museum, presenting newly acquired facts in zoology, geology, and anthropology, including descriptions of new forms of animals, and revisions of limited groups. One or two volumes are issued annually and distributed to libraries and scientific organizations. A limited number of copies of each paper, in pamphlet form, is distributed to specialists and others interested in the different subjects, as soon as printed. The date of publication is printed on each paper, and these dates are also recorded in the tables of contents of the volumes.

The *Bulletins*, the first of which was issued in 1875, consist of a series of separate publications comprising chiefly monographs of large zoological groups and other general systematic treatises (occasionally in several volumes), faunal works, reports of expeditions, and catalogues of type-specimens, special collections, etc. The majority of the volumes are octavos, but a quarto size has been adopted in a few instances in which large plates were regarded as indispensable.

Since 1902 a series of octavo volumes containing papers relating to the botanical collections of the Museum, and known as the *Contributions from the National Herbarium*, has been published as bulletins.

The present work forms No. 79 of the *Bulletin* series.

RICHARD RATHBUN,

*Assistant Secretary, Smithsonian Institution,
In charge of the United States National Museum.*

WASHINGTON, D. C., December 10, 1912.

PREFACE.

The object of the present Bulletin is twofold: To call attention to the richness of the United States National Museum in North American land mammals, and to furnish a summary of the systematic results of study in this field to the end of the year 1911.¹ North America as here understood is the entire continent from Panama northward, together with Greenland and the Greater and Lesser Antilles. In no other museum is the mammal fauna of so large an area so fully represented. Some idea of the completeness of this representation may be gained from the following tabular synopsis:

Family.	Number of forms recognized.	Number of forms in collection.	Number of forms not represented.	Eu-types.	Hy-po-types.	Family.	Number of forms recognized.	Number of forms in collection.	Number of forms not represented.	Eu-types.	Hy-po-types.

LIST OF NORTH AMERICAN LAND MAMMALS IN THE UNITED STATES NATIONAL MUSEUM, 1911.

By GERRIT S. MILLER, Jr.,

Curator, Division of Mammals, United States National Museum.

The collection of North American mammals in the United States National Museum numbers about 120,000 specimens, including 1,135 types. More than five-sixths of this material is in the Biological Survey collection, United States Department of Agriculture,¹ the remainder, containing all of the older, more historic specimens, is in the Museum proper. The material derived from these two sources furnishes so complete a representation of the mammals of North America that of the 2,138 forms now² recognized less than 200 are not included.

In preparing this list, with the object of making it fulfill its double purpose, the following plan has been adopted. In 1885³ Dr. F. W. True published "A Provisional List of the Mammals of North and Central America and the West Indian Islands," a summary of the North American mammal fauna as then known. To the species included in it are added those since recognized, the status of which at the end of the year 1911 had not been questioned in some recent work of definite monographic character, where full synonymy and references may readily be consulted. Forms in regard to whose standing there is difference of opinion, but which have not been treated in such a monographic paper, are included; but in cases of this kind references are given to the conflicting views. An asterisk is placed before the name of each form represented in the national collection.

¹ The number of specimens entered in the catalogues of this collection up to the end of December, 1911, is 107,517. This material, brought together wholly by the activities of the Biological Survey, belongs according to act of Congress (sundry civil act of Mar. 3, 1879), to the United States National Museum. By the same authority it is maintained as a separate collection pending investigations by members of the survey. The wording of the act is as follows: "And all collections of rocks, minerals, soils, fossils, and objects of natural history, archeology, and ethnology, made by the Coast and Interior Survey, the Geological Survey, or by any other parties of the Government of the United States, when no longer needed for the investigations in progress, shall be deposited in the National Museum."

² The number known in 1885 was 363; in 1900 this had been increased to about 1,450. (See Miller and Rehn, *Proc. Boston Soc. Nat. Hist.*, vol. 30, p. 1, Dec. 27, 1901.)

³ *Proc. U. S. Nat. Mus.*, vol. 7, 1884, pp. 587-611 (appendix). 1885.

A dagger indicates that the type is also here. It is to be clearly understood that, especially in unrevised genera, the indication that a given form is in the collection implies nothing more than the presence of a specimen of the animal on which a particular name was based. The sequence of groups is, in its main features, that adopted by Osborn in his "Age of Mammals," 1910, though the arrangement of the families and genera has been revised to make it as consistently as possible in harmony with that of the higher groups; that is, to begin with the more generalized forms and end with those showing the highest degree of specialization.¹ Under every species and subspecies reference is made to the first publication of the specific or subspecific name. To this, when necessary, is added, (a) reference to first use of current binomial or trinomial, (b) in the case of species described before 1885, but not at that date admitted as valid, reference to establishment as members of the North American fauna, and (c) reference to True's list.² References to alterations in generic names are also given, but the concordance with the nomenclature of 1885, being sufficiently indicated by the citations under species, is here omitted. The type locality of each form is stated with all possible exactitude; and in revised genera the ranges are given as printed by the author. All questions of nomenclature have been decided in accordance with the International Zoological Code.

¹ This portion of the work, together with a review of the status of genera and subgenera, is the result of original investigation; elsewhere the strictly historical method has been adhered to as closely as possible except in cases where it would cause the perpetuation of obvious errors.

² No attempt is made with the many species which prove to have been composite as understood in 1885 to apportion the name then used to each of the component parts as they now stand. The word "part" in parenthesis, after the reference, indicates that segregation has taken place.
