1997

The **St. Johns River Water Management District** (SJRWMD) was created by the Florida Legislature in 1972 to be one of five water management districts in Florida. It includes all or part of 19 counties in northeast Florida. The mission of SJRWMD is to manage water resources to ensure their continued availability while maximizing both environmental and economic benefits. It accomplishes its mission through regulation; applied research; assistance to federal, state, and local governments; operation and maintenance of water control works; and land acquisition and management.

Special Publications are published to disseminate information collected by SJRWMD in pursuit of its mission. Copies of this report can be obtained from:

PREFACE

The authors gratefully acknowledge the assistance of all those who contributed references, papers, reports and other Indian River Lagoon documents to the Marine Resources Council of Brevard County. The Marine Resources Council cooperated in providing all of the Indian River Lagoon-related citations that had been received in their office since the publication of the first edition. We continue to encourage submission of references to literature, reports, photographs, maps, and other relevant scientific information for future inclusion in a third edition.

The cost to produce this second edition of the Indian River Lagoon Scientific Information System bibliography was shared by the South Florida Water Management District and the St. Johns River Water Management District.

INTRODUCTION

The Indian River Lagoon (IRL), for purposes of water management planning under Florida's Surface Water Improvement and Management (SWIM) Act, encompasses the Mosquito Lagoon, the Banana River, and the Indian River, from Ponce de Leon Inlet in Volusia County to Jupiter Inlet in Palm Beach County.

Scientists, students, government officials, and citizens of the IRL counties have recognized the need for a centralized source of references to scientific and technical information about the IRL for many years. The existence of a comprehensive information resource is vitally important for determining what we know about the lagoon's various components and systems, for comparing the results of studies or investigations with previous findings by others, for initiating and carrying out new studies, and for summarizing and understanding the lagoon's characteristics and trends.

Information on the IRL exists in many forms. These include scientific journal articles and academic theses, as well as popular books and news accounts, charts, photographs, and collections of observations and measurements. The Indian River Lagoon Scientific Information System (IRLSIS) does not exclude information in any form as long as it provides some insight into the function of this estuary.

The documentation of IRL information (IRLSIS) is continually evolving. It will continue to grow as more people search the bibliography, use the system as a centralized source of direction to the available information, and suggest missing information for inclusion in the database.

IRLSIS consists of two interrelated parts: (1) a collection of original documents, maps, photographs, and other types of information and (2) a computerized database that contains bibliographic references and supplementary categories and keywords to facilitate searches for specific items of information. These bibliographic references, combined with supplementary information, are called "citations," which somewhat extends the accepted definition of the term. Specifically, in this bibliography, a citation consists of information about a particular document, map, etc., and includes the traditional reference to author(s), title, date, and publisher. It also indicates the type of document or information source, where it was obtained, where copies are located, and keywords and codes that can be used to search for various combinations of these references.

In 1986, the first plans were made for the development of a computerized system, using

funding from the Florida Department of Environmental Regulation provided through a grant to the South Florida Water Management District (SFWMD) and the St. Johns River Water Management District (SJRWMD). The database was developed by the SFWMD, and has been extensively updated by the SJRWMD. Data entry was initially performed by the Marine Resources Council (MRC) and the Florida Institute of Technology, and later by Julie Miller.

The first publication of the citations in IRLSIS was completed in 1989. This edition, as will future editions, lists the complete set of citations contained in the database at the time of publication, not just those added since the previous edition. The bibliography has been printed directly from the IRLSIS database and is divided into nine parts, the main text and eight appendices—A1, A2, and B through G (see Table 1).

Entry of new citations into the database was suspended in July 1994 in order to begin checking the entries and the database integrity prior to producing the bibliography.

CITATION CONTENTS

Citations are listed in the bibliography in alphabetical order by first author. Each citation listing contains the elements listed in Figure 1. Each citation is divided into four major parts:

- Citation number
- Bibliographic reference material
- Citation information
- Keywords

CITATION NUMBER

Each citation is identified by a citation number, going in sequence from 1 to 3492. The numbers are used in Appendixes A through G to identify the citations contained in the "Listing of Full Citations and Keywords," the "main text" in the bibliography. The citation numbers used in each edition will be stored in the database, providing a way to track citations from one edition to the next. Each citation is also identified by a unique acquisition number, which is not printed in the bibliography but is stored in the database. MRC staff use the acquisition numbers to identify citations in citation records that are maintained on paper.

BIBLIOGRAPHIC REFERENCE MATERIAL

Author(s) Names. The names of all authors of a document are stored in a "multiple author(s)" database file. The name of each individual author, of which there are 2,928 in the second edition, is stored in an "individual author" database file. In the citation listing, the first author's name is inverted; following names are not inverted. The names are stored exactly as published in the original document. No attempt was made to try to relate different name forms or spellings to one person; thus, the same author may be represented more than once if his/her name was spelled

differently in different citations. Each author text has been independently checked against a copy of the original text. If no copy of the original text was available, as is the case when the reference was taken from another bibliography or from the list of references at the end of a journal article (citations coded as "unseen"), inadvertent errors may have been transferred into the database. Citation listings for multiple authors are indexed alphabetically by primary author in Appendix C. Citation listings are indexed alphabetically by individual author in Appendix D.

Year of Publication. The year of publication, taken from the original document if available, is the year that the document was published or the year it was released if it is unpublished. If no date is available, the code "N.D." is stored and printed.

Title. The title is stored exactly as recorded in the original document. Each title, of which there are 3,408 in the second edition, has been checked for accuracy against the original. If the original source is not available, errors may have been inadvertently transferred to the database. Citations are indexed alphabetically by title in Appendix E.

Citation Reference and Publisher. Reference information includes the publisher, city, date of publication, and report number and any other relevant items. Both the form and the abbreviations were taken from a standard biological bibliographic reference (see p. 13). These biological abbreviations are supplemented with abbreviations for other common, IRL-specific names or terms.

Citation Information

The type of the citation—book, journal article, map, etc.—is recorded in the citation database file using up to three different codes: category, subcategory, and media. In most cases, these descriptors are self-explanatory. Citations are indexed by category and subcategory in Appendix B. There is no separate index by media.

Category. Category codes (Table 2) are used in conjunction with the other two type codes (subcategory and media) to define the type of the citation, that is, whether it is a book, article, set of data, or some other type of information. The categories were selected in order to divide the indexes to the citations into major groups that would be convenient for initial searches before the user tries more refined, detailed searches.

Subcategory. Subcategory codes (Table 3) are used with category codes to identify the content of a citation. For example, the category "article" may be subdivided into journal, magazine, newsletter, etc.; biological, chemical, geological, etc.;

bibliography, book, text, etc.; or other subcategories. Note that there is some repetition

in category and subcategory codes (specifically, audio/visual, bibliography, book, chapter, and report) to provide the user with more freedom to select the combination that will be most useful. For example, one may use category book with subcategory water quality, or category abstract with subcategory book. It was necessary to provide this flexibility because the database design was completed before this feature had been fully considered. There were only two type codes to work with (category and subcategory), and some of the categories, such as "abstract," are above the hierarchical level of other categories.

Thus, a citation may be categorized, for example, either as (category) abstract (subcategory) book or as (category) book (subcategory) biological. The "code" number in this and other tables is internal to the database and is not printed.

Media. Media codes (Table 4) describe the physical form of the reference. The emphasis in this type code is on the type of material on which the information is stored, not its contents. Additional types of media may be added to the system. Media are listed for each citation, but are not separately indexed.

Note: Only one item can be stored from each of the three sets of citation type descriptions. However, it is possible to add new codes into each set of type codes in the database.

Sponsor. The sponsor code (Table 6) permits a citation to be designated as to the type of organization that produced it. Sponsors are indexed in Appendix G.

Published/Unpublished. The term "publish" describes a document that is publicly distributed. The code "Y" for yes, "N" for no, or "U" for unknown is stored in this field. If no code is stored in the database for a document, "unknown" or "uncoded" is displayed in the citation listing.

Table 6. Sponsor codes

5	Non-profit organization	98	(uncoded)
6	Private	99	(unknown)

The publisher is listed as part of the citation reference, and the publisher name is stored separately in the database, but not printed as a separate item. Citations are indexed by publisher in Appendix F.

Copy Locations. Up to three locations for copies of the citation may be recorded in the database. If a copy is contained in the IRL library, it is referenced as "IRL collection, MRC"; if it can be found in the Florida Institute of Technology (FIT) library, it is so referenced. Up to 20 characters can be saved in each copy location field. Table 7 contains a list of copy location codes and corresponding location descriptions.

Citations Seen/Not Seen. If an MRC researcher has seen the text of a document, as opposed to only a reference to it in another citation, it is recorded as being seen and the known locations of copies are entered into the "Copies Located" fields. MRC has checked the IRLSIS entries of citations that have been seen and compared them against the original text, if available. The citation references to unseen items may not be as accurate, due to the possibility of unchecked typographical errors in other publications.

Abstract Available/Not Available. The IRLSIS database contains space in which an abstract can be stored for any citation; no abstracts have yet been entered into IRLSIS. If an abstract was published with the work, and if a copy of the abstract is located in the IRL library, the citation listing will indicate that an abstract is available.

Keyword Source. If a document was published with a list of keywords, it is assumed that the document had been keyworded by the author. Otherwise, keywords were taken from the title or contents by MRC staff, or were found by one of the methods listed in Table 8.

Table 8. Keyword source codes

KEYWORDS

In the database, keywords are recorded in a 25-character field, accompanied by a 60-character field called Keyword Description. However, only the short keyword is listed with the citations in this bibliography. In many cases, the 25 characters are adequate to contain the full keyword. In those instances where the full keyword is longer, the keyword was either abbreviated or truncated. The abbreviated or truncated keywords and corresponding keyword descriptions are listed in Appendix A1. Citations are indexed by keyword in Appendix A2. There are 3,554 separate keywords in this edition, of which 152 are long keywords.

Keywords have not yet been checked independently for spelling or correctness. The authors would appreciate any suggested

corrections from users. See the last page of the bibliography for a correction form that can be copied and sent to the author at SJRWMD.

INFORMATION NOT INCLUDED IN LISTING

Source Reference. Source references are not printed in this bibliography but are described here because the user should know that they are included in the database with each citation. The source of a citation is the name of the reference from which the citation was first obtained. It might be a published bibliography, a journal article, a news account, a personal communication, or any other entity that could provide a reference to the work.

ORIGINAL GUIDELINES AND STANDARDS

A set of general guidelines for the following topics was originally established for the organization of the database and for data entry.

- Types of information to be included
- Sources of information
- Number of databases in existence
- Maintenance of the database
- Content and format of citations

TYPES OF INFORMATION TO BE INCLUDED

It was decided the bibliography should be designed to store references to any type of information that could be of potential use to researchers working on aspects of the natural resources of the IRL. Thus it was anticipated that, in addition to scientific articles, the database would contain references to maps, photographs, sets of data, historical books, and a variety of other forms of information. A broad set of categories was established to provide access to each type of data.

In order to limit the collection to references to the IRL, an effort was made to leave out general materials that did not specifically address or apply to the particular conditions in the IRL. However, such general information may be included if it is important for researchers to be aware of its existence.

SOURCES OF INFORMATION

A concerted effort was made in the first years of the data entry project to cover the obvious and principal sources of IRL data in Florida. In addition, some federal sources were searched, but the effort has concentrated on public, commercial, and private sources within Florida that are likely to have a quantity of different, useful references.

NUMBER OF DATABASES IN EXISTENCE

Multiple versions of a database must be avoided, or at least carefully managed, as it is difficult to reconcile differences and to merge two different versions. During the development of the IRLSIS programs, it was necessary on several occasions to work with a copy of the original database, but the database that was managed by MRC was always considered to be the true collection. Responsibility for the database has been transferred to SJRWMD.

One exception can be made, which is the special instance in which a new database is started from an existing database and there are no plans to join the two later. IRLSIS has a built-in capability to define one or more separate sub-databases, using

a database name assigned to each citation and limiting searches to the database sub-name.

Maintenance of the Database

Maintenance of the database involves periodic cross-checking of the contents, ongoing editing of existing entries, locating and deleting duplicate entries, and adding and verifying new citations. Ongoing maintenance and updating of the database would require approximately one half-time person.

Content and Format of Citations

As IRLSIS would probably have a predominance of scientific, and particularly biological, references, a style manual for biological journals was used as a guide for the format of citations (CBE Style Manual Committee, 1978, Council of Biology Editors Style Manual). Abbreviations were derived from the CBE style manual and were selected from standard library lists of abbreviations. The abbreviations listed in Table 9 are used consistently in IRLSIS.

DataFlex Database Implementation

The IRLSIS database has been implemented with a general purpose, relational database system called DataFlex, distributed by Data Access Corporation, Miami, Florida. DataFlex is available in either of two versions: the Run-time System and the Application Development System. The Run-time System is a subset of the complete system, containing all the modules needed to use an application such as IRLSIS. The Application System includes, in addition to the Run-time System, an editor, a compiler, and all the additional programs needed to create or modify an application. DataFlex programs are written in a unique, higher level programming language; some simple programs can be produced automatically by means of system menus. Each DataFlex system in use must be purchased and registered with Data Access Corp. DataFlex can be obtained for most computers and operating systems, including PC clones.

DataFlex was selected for IRLSIS because, at the time, no other database system could be found with adequate power and flexibility. Flexibility was important in order to provide an ability to include any desired fields and file relationships, modify the database in the future, prepare output formats in desired formats, and run on an AT class microcomputer. DataFlex has many advantages; however, it is licensed, and a Run-time System must be purchased in order to run the IRLSIS application.

IRLSIS is made up of 11 separate files, each called a "database," that are linked in a relational hierarchy. Each of these files has an 8-character name beginning with the letters "LIBIB" and an arbitrary identifying number between 119 and 129. Because it is a relational database system, each item of information is stored in only one database file and logical links provide the paths over which these different items can be accessed and combined for display or for printing specific citations.

Each database has a set of predefined indexes and associated key files that are used to search for data items. As data are entered for each citation, the key files are updated immediately. Those fields that have been indexed in the design of the system can be searched and retrieved by a function key or program; all related fields are then accessible. An abbreviated guide to the function of each function key is displayed at the bottom of each program during operation. The ten keyboard function keys are used to perform common tasks, such as searching for a particular record in the system. Data are searched and retrieved so rapidly that there is almost no time lag after a single request.

The alphabetization of the authors, titles, and publishers names conforms with bibliographic practice, which is not the same sorting sequence as ASCII (American Standard Code for Information Interchange). For example, St (Saint) appears between "sai" and "saj." To make this modified alphabetic order possible, a code consisting of a single letter and five digits was established for each author, title, and publisher; the codes are assigned manually to each item. When a list of authors is printed, the desired order is achieved by accessing the author code in ASCII order and printing the corresponding author text.

DataFlex is provided with a hierarchical menu system that has been defined in a particular way for IRLSIS. Two principal functions are available to the user through these menus: selection of particular citations according to selection criteria specified by the user, and printout of the results of the database search and selection. Citations may be selected by any of the seven categories used to index the bibliography, or by combinations of these categories.

In addition to the database files discussed, a set of databases was created for sorting edition/citation numbers for the publication of the bibliography. The databases in the set are numbered 109 through 118.

One other database (#108) describes each of the programs used to enter and maintain data, run IRLSIS and DataFlex, and print the bibliography.

APPENDIX E—LISTING OF TITLES BY CITATION NUMBER

TITLE	CITATION NUMBERS
13C/12C ratios and the trophic importance of algae in Florida Syringodium filiforme seagrass meadows.	1125
1971 inventories of coastal Florida's pelican population.	1088
1972 St. Lucie, Florida meteorological summary.	1813
1976 real estate subdivision index.	346
1978-1979 fish management report.	1912
1980 census tract data.	342
1982 sea turtle project: Final report Canaveral National Seashore.	1919
1983 sea turtle nesting survey at Merritt Island and Cape Canaveral, Florida.	2369
1986 Florida water quality assessment 305(b) technical report.	1342
1988 annual report.	2659
1988 FLORIDA STATISTICAL ABSTRACT.	2705
1990 census data report volume 1.	2431
24-hour rainfall distributions for surface water basins within the St. Johns River Water Management District, northeast Florida.	241
26 ecological communities of Florida.	1048
201/208 water quality section (Brevard County) data report.	196
208 - 201 programs.	354
208 areawide wastewater treatment management plan.	2329
208 planning and designation information - the Brevard County standard metropolitan statistical area and environs.	341
40,000 – ACRES – 40,000 IN BREVARD COUNTY.	45
Above-ground primary production in ditched impounded and natural marshes along the Indian River Lagoon.	2468
Above-ground primary production in impounded, ditched, and natural marshes along the Indian River lagoon.	2459
Absorption efficiencies of the intertidal mangrove dwelling mollusk Melampus coffeus Linne and the rocky intertidal mollusk Acanthopleura granulata Gmelin.	2029
ABSTRACT OF BREVARD COUNTY WILL BOOK NO. 1, 1886-1905 AT TITUSVILLE, FLORIDA.	369
Abundance and distribution of the West Indian manatee in the Grand Canal, Brevard County, Florida.	1456, 1457
The abundance and distribution of the West Indian manatee (Trichechus manatus Latirostris) in the North Canal (C54) of the Sebastian River.	1455
Abundance, distribution, and feeding habitats of manatees (Trichechus manatus) wintering between St. Lucie and Palm Beach Inlets, Florida.	2219
Abundance, distribution and movements of manatees (Trichechus manatus) in Brevard County, Florida.	2687
Abundance, distribution and use of power plant effluent by manatees (Trichechus manatus) in Brevard County, Florida.	2686
