Subject: RE: PEF LNP - Domestic Wastewater Conditions

Mike, as noted in the discussion below, as well as our discussion yesterday, please note that PEF is seeking to have the Conditions of Certification worded to allow for the flexibility of treating domestic wastewater onsite (in compliance with applicable State rules), as well as the previously indentified discharge via the cooling tower blowdown stream (to Crystal River discharge canal). As noted below, this is not a new facility, or waste steam, rather the proposed condition is merely to address the domestic system. Currently, PEF is in the process of evaluating the preferred option for treatment of the domestic wastewater generated by this system and would like to maintain in the COCs the flexibility to either treat onsite or discharge offsite. As you know, any offsite discharge of the wastewater will also need to be addressed in the NPDES permit evaluation.

Please let me know if additional information regarding this subject is necessary at this time...

Thanks.

Doug, we have identified the onsite domestic wastewater treatment plant as part of the SCA. This is not a new facility. The condition was proposed to allow post-certification submittal of the details of the facility and disposal. This condition matches up with the approach being taken for the potable water system.

We are not proposing the domestic wastewater facility as a new item now or as a post-certification submittal.

We are considering using onsite disposal with infiltration trenches, as opposed to the current proposal to discharge the domestic wastewater effluent to Crystal Bay at the Crystal River Plant. We would hope the conditions could cover this possibility for onsite disposal since it would eliminate a surface water discharge.

So I would encourage the Department to include this condition. Otherwise, there would likely be no review of the construction of this facility by DEP under the current conditions.
